REFLECTION

Issues/Bugs:
Most of the issues that I ran into while coding this assignment had to do with formatting the page and making the grid align properly. Since HTML/CSS doesn't really have error messages or print statements, it's a lot harder to understand why something isn't working. Therefore, working on the actual layout of the page caused more issues than coding the javascript functionality of the page. One of the biggest issues I found was making the divs stay in line or appear on new lines. I found that a helpful way to tell what is happening with the divs is to create a solid border so that I can see exactly where the boundaries of the div are and how they relate to the other objects.

Additionally, I struggled with the syntax and functional capabilities of javascript at first since I'm used to coding in Python. I used online resources to see what I could feasibly code with javascript and how the code should be structured.
